

Can interact with both and operations

Direct access to data is removed and only operations are opened for access

Ex -

Encapsulation:

- * Combining data and operations
- * Helps in restricting direct access to data.

A class is a template to create an object, it usually combines data and behaviour

```
class Account {  
    int accountNo;  
    double balance;  
  
    void withdraw(double amt) {...}  
    void deposit(double amt) {...}  
}
```

```
Account acc1 = new Account();  
Account acc2 = new Account();  
Account acc3 = new Account();
```
